

Perisserosa guttata

Origin: E. China Sea.

Author: Gmelin 1791

Size: 57mm. **Grade:** F2

" *Great Spotted Cowry / Drop Covered Cowry* " This species has been given numerous form names some I think dubious, most shells change slightly by location & depth. Not so available now since cyclones wreaked havoc in the region. Unusually small spots with a concentration of them on the anterior ramp. I may have been a bit hard on the grade but there is a tiny sand inclusion on the dorsum & on the columellar side of the base. An excellent size. The ends intact.
