

*Erosaria lamarckii redmita f. phuketensis* (Gray, 1825) - HYPER-CALLOUSED, SUPER ROUNDED SHELL, BIG SIZED SHELL! FULLY MATURE! This pair of rare, spectacular shells are only found very occasionally in a restricted locality and hardly in this QUALITY! Truly a special shell with HYPER-THICKENED MARGINS with INTENSE MARGINAL LEOPARD SPOTTING! Clear and crisp dorsal spotting! I included a normal *lamarckii* (last photo) from a neighbouring locality to showcase the STARK DIFFERENCES. I am giving it a gem- due to some very small growth defects, and thats the only reason why. Very common and natural irregularities Size: 28/ 27mm      Quality: Gem-
