

*Tegula regina*. It measures 33 mm tall and 43 mm across the base. This specimen has the uncommon color pattern of gold with dark brown bands. It is in very good condition, with operculum (there are nicks to the operculum). The dorsal side has nice sculpture, with the dark brown banding and gold color. The ventral side has great iridescent colors. There is a tiny nick on the white part of the aperture (center). It was live collected at Catalina Island, California in 1969
