

Cassis fimbriata

Origin: S.W. Aust.

Author: Q & G 1833

Size: 91.5mm.

Grade: F2

" *Fimbriate Helmet* " A good sized shell. The anterior canal which is typically broken is mostly intact here but for a small anomaly on top of the left side of the canal. I also noted a predator needle perforation low on the left side between the two rows of shoulder nodules. A portion of the columellar shield absent towards the anterior. Taken from a lobster trap in the deeper waters. A good second grade piece.
