

Conus milneedwardsi *Jousseaume, 1894*

Ultra rare! Gorgeous Dark! 81.1 mm

South Red sea. Eritrea. Superba! Fantastic shells! It's not funny, but almost no specimens of "Nominative" milneedwardsi in the collection has this look. 99% of all Conus "Glory of India" that are in collections are Indian C. milneedwardsi clytospira, which have been caught by thousands in recent times. If you compare these two subspecies, the difference will be enormous. The nominative species has always been a very rare shell. Having a fresh specimens in such stunning quality and color is a big luck.
