

**FUSCORUBRA - SUPER SOUTH AFRICA 33.1 mm  
GEM - A1093**

Quality: F+++ / GEM I see no important flaws. Typical fine lines.

Collected: Hout Bay area at 35 to 38 meters, South Africa.

Comments: Super dark specimen and great pattern. High quality specimen. As a dealer we're very lucky that we know people who keep some of the top specimens from South Africa for us, at an affordable price. We cannot emphasize enough that prices for South African shells are going up very rapidly because very few are found and most aren't in a good condition.

45 \$, April
