

*stercoraria*

*Delicious spotted mature superdwarf with incipient overcasting:*

Remarks: It is interesting to note that algal overcasting starts just on the mantle line area, where the animal is not protected, then it will spread over the central dorsum. This should be the reason for ovc trend to be confined and full ovc seldom seen in live collected specimens.

From old collection

Live collected at the estuary of Libreville, Gabon, 90's

40,8 mm F+++GEM ovc
