

CYPRAEA TAITAE - VERY RARE 14.2 mm

Quality: NO RATING. Please judge the photos carefully.

Collected: Data included with the shell. Samoa.

Comments: A tiny 1 mm inclusion under gloss on the dorsum near the anterior canal. Probably a repaired drill attempt - but I doubt this, because of the unusual spot for drill attempts, or damaged by a falling piece of collar. A very short hairline starts at this inclusion. Black line on the base is a dust particle, not a flaw!! Live taken specimen with full gloss. Beautiful pattern. Perfect canals.
