

an impressive piece of the very rare Australian cowrie
Umbilia eximia (Tate, 1889) 94.3 mm, Victoria. Age: Middle
Miocene epoch, approximately 14.5 million years. This piece
is in very good condition and of good size, with the
characteristic and commanding siphons well-developed and
exhibiting great maturity. I urge close examination of the
photos provided for a comprehensive description of the
condition of this exquisite fossil. Suited for an advanced fossil
collection.
