

Large and sensational *Pugilina morio* (Linnaeus, 1758) F+++  
210 mm, Cameroon, West Africa, now available. This is a  
very large specimen, exceeding 200 mm in length, and with  
stunning dark chocolate colouration overlain by cream and  
orange transverse bands above the suture. This shell is in  
overall excellent condition - apart from a two minor growth  
lines (that do not at all appear intrusive due to their straight  
appearance and the fact that they are hidden by the very  
dark colour), the shell is very hard to fault
