

*Pugilina morio* (Linnaeus, 1758) F++/F+++, 195 mm , West Africa, now available. Stunning dark chocolate colouration overlain by cream and orange transverse bands above a deeply impressed suture. Imposing proportions, and a dramatically contrasting, light-coloured aperture, resulting in a particularly striking appearance. Growth scar on base and siphonal canal, but not intrusive (particularly due to dark colour which tends to hide such marks).
