

***Purpurellus pinniger*, Broderip, has the operculum and measures 67 mm. The varices are not perfect and there are a lot of borings. Although not a great specimen, it is representative of the species, has good data and was live taken. Data: Trawled in the entrance of Bahia Culebra on gravel/rocky bottom, at 10° 36' N 85° 41.5' W, South of Papagayo Peninsula, Guanacaste, Costa Rica 17 March 1966**
