

Laevistrombus turturella (Röding, 1798) - SELF COLLECTED,
WITH PERIOSTRACUM AND ORIGINAL OPERCULUM! That is
right! Rarely offered in such a style, and I understand that
though it is a common species, it is uncommon for it to retain
its APEX and SIPHONAL CANAL. Apart from a small small
wormhole, it is more or less intact.

Size: 49mm Quality: F+++

Collecting Data: Singapore, 2017.
