

**Strombus alatus F. Sloani extrêmement rare aberrant! 78 mm**

This is a truly rare shell that seldom changes hands. *Strombus pugilis* f. *sloani* is more familiar, but what many people do not know is that *Strombus alatus* also develops the same type of odd club shaped "spines". This specimen has a thin lip with some chips and one growth mend. However it is mature in other ways so I am hesitant to call the shell a subadult. It is so rarely offered I can't even find a comparable price.
