

Terebra Maculata WO (Linnaeus, 1758). Location: S . Shore Oahu, HI
Grade: F+++/almost Size: 205.0mm. Notes: This Terebra Maculata was self collected on a day dive in 120ft of water in open sand, just follow the trail to the big bump and surprise :).....I always enjoy this kind of a dive as you float around 90ft following the trails and go down for the prize. This Terebra Maculata has a natural lip in excellent condition, well defined pattern, PERFECT tip, EXTRA LARGE and heavy, my wife is 5'6 so I put it in her hands so you can get a good representation of its size and color, only issues are two slight flaws towards the top part of the shell 3rd photo if you can see them, closer to the tip in 2 different areas, very hard to see in the photo's.
