

## **Cymbium pachyus**

**Origin:** Cameroon.

**Author:** Pallary 1930

**Size:** 73mm, 113.2

**Grade:** F2

"*Dilated Baler*" This species glazes over the top of its periostracum and then it delaminates as they age. They also have sand inclusions as a natural trait. Compare with those illustrated on [www.gastropods.com](http://www.gastropods.com) A smaller one included to demonstrate how they change with time. Most are found with damaged outer lips but intact here. They live in rough waters in muddy substrate. Classified as rare.
